# NON-IMIDAZOLE ALKYLAMINES AS HISTAMINE H<sub>3</sub>-RECEPTOR LIGANDS AND THEIR THERAPEUTIC APPLICATIONS.

The present invention relates to alkylamines of formula (A) as  
5 defined hereafter, to their preparation and to their therapeutic applications.

Antagonists of histamine H<sub>3</sub>-receptor are known especially to  
increase synthesis and release of cerebral histamine. Through this mechanism,  
they induce an extended wakefulness, an improvement in cognitive processes,  
a reduction in food intake and a normalization of vestibular reflexes (Schwartz  
10 et al., *Physiol. Rev.*, 1991, 71: 1-51).

Whence these agents are potentially useful in several central  
nervous system disorders such as Alzheimer disease, mood and attention  
alterations, cognitive deficits in psychiatric pathologies, obesity, vertigo and  
motion sickness.

15 Histamine H<sub>3</sub>-receptor agonists are known to inhibit the release of  
several neurotransmitters including histamine, monoamines and neuropeptides  
and thereby exert sedative and sleep-promoting effects in brain. In peripheral  
tissues, H<sub>3</sub>-receptor agonists exert namely anti-inflammatory, anti-nociceptive,  
gastro-intestinal, antisecretory smooth muscle decontracting activities.

20 All the H<sub>3</sub> receptor antagonist or agonist compounds known so far  
resemble histamine in possessing an imidazole ring generally monosubstituted  
in 4(5)-position (Ganellin et al., *Ars Pharmaceutica*, 1995, 36:3, 455-468; Stark  
et al., *Drug of the Future*, 1996, 21(5), 507-520).

Numerous patents and patent applications are directed to  
25 antagonist and/or agonist compounds having such structure, in particular EP  
197 840, EP 494 010, WO 93/14070, WO 96/29315, WO 92/15 567, WO  
93/20061, WO 93/20062, WO 95/11894, US 5 486 526, WO 93/12107, WO  
93/12108, WO 95/14007, WO 95/06037, WO 97/29092, EP 680 960, WO  
96/38141, WO 96/38142, WO 96/40126.

30 In the literature, Plazzi et al., *Eur. J. Med. Chem.* 1995, 30, 881,  
Clitherow et al., *Bioorg. & Med. Chem. Lett.* 6 (7), 833-838 (1996) Wolin et al.,  
*Bioorg. & Med. Chem. Lett.* 8, 2157 (1998) can be cited also in this respect.

Nevertheless, such imidazole derivatives may show drawbacks such as poor blood-brain barrier penetration, interaction with cytochrome P-450 proteins and/or some hepatic and ocular toxicities.

Non-imidazole known neuro-active compounds such as  
5 betahistidine (J-M. Arrang et al., Eur. J. Pharmacol. 1985, 111: 72-84), phencyclidine (J-M. Arrang et al., Eur. J. Pharmacol. 1988, 157: 31-35), dimaprit (J-C Schwartz et al., Agents Actions 1990, 30: 13-23), clozapine (M. Kathmann et al., Psychopharmacology 1994, 116: 464-468), and sesquiterpenes (M. Takigawa et al., JP 06 345 642 (20 Dec 1994)) were suggested to display H<sub>3</sub>-  
10 receptor antagonism but all these compounds have only very low potency.

These compounds were previously known as therapeutic agent before the discovery and characterization of the histamine H<sub>3</sub>-receptor, in particular as neuro-active agents for example as neuroleptic (clozapine) or psychotomimetic (Phencyclidine) agent.

15 When tested at the H<sub>3</sub>-receptor, these compounds were shown to display much lower potency than the imidazole-containing compounds described in patent applications quoted above.

Attempts at replacing the imidazole ring was generally not successful and no potent H<sub>3</sub>-receptor ligands not containing such ring was  
20 reported in the literature up to now.

These investigations showed the importance of the 4(5)-imidazole moiety.

The objective of the invention is to provide new potent H<sub>3</sub>-receptor ligands which may reduce the above-mentioned drawbacks.

25 The present invention provides new compounds, the structure of which does not contain an imidazole moiety, which are useful as histamine H<sub>3</sub>-receptor ligands.

The compounds of the invention have the following general formula (A):

30

in which:

- W is a residue which imparts antagonistic and/or agonistic activity at histamine H<sub>3</sub>-receptors when attached to an imidazole ring in 4(5)-position;
  - R<sup>1</sup> and R<sup>2</sup> may be identical or different and represent each independently
    - a lower alkyl or cycloalkyl,
- 5 or taken together with the nitrogen atom to which they are attached,
- a saturated nitrogen-containing ring

10 with m ranging from 2 to 8, or

- a non-aromatic unsaturated nitrogen-containing ring

15

with p and q being from 0 to 3 independently and r being from 0 to 4, provided that p and q are not simultaneously 0 and  $2 \leq p + q + r \leq 8$ ,

R<sup>a-d</sup> being independently a hydrogen atom or a lower alkyl, cycloalkyl, or  
 20 carboalkoxy group, or

- a morpholino group, or
- a N-substituted piperazino group:

25

with R being a lower alkyl, cycloalkyl, carboalkoxy, aryl, arylalkyl, an alkanoyl or aroyl group.

The inventors have found, surprisingly, that antagonist and/or agonist compounds can be obtained by substituting a di(alkyl) or  
 30 (cycloalkyl)amine, or a non-aromatic nitrogen-containing ring -NR<sup>1</sup>R<sup>2</sup> as above-defined for the imidazole ring, in known antagonist and/or agonist imidazole derivatives.

It is also believed that antagonist and/or agonist activity can be foreseen, by equivalence, for compounds according to formula (A) having a W residue of imidazole derivatives which were suggested in the prior art as H<sub>3</sub> antagonists or agonists, and further for those W residues which would belong to future imidazole derivatives having substantial H<sub>3</sub> antagonist and/or agonist activity.

Moreover, the inventors have observed that such non-imidazole analogues can provide potent antagonist and/or agonist activity.

In this regards, they have prepared novel non-imidazole alkylamines analogues of formula (A) corresponding to known imidazole derivatives in particular from the above-mentioned prior art.

The invention also relates to the addition salts which the compounds form with pharmaceutically acceptable acids. The pharmaceutically acceptable salts comprise the nontoxic salt of inorganic or organic acids. Examples of these salts include the hydrochloride, the hydrobromide or the hydrogen maleate or hydrogen oxalate.

The present invention also encompasses the hydrates of the compounds, the hydrated salts of these compounds and the polymorphic crystalline structures.

When the compounds can exist in one or a number of isomeric forms according to the number of asymmetric centres in the molecule, the invention relates both to all the optical isomers and to their racemic modifications and the corresponding diastereoisomers. The separation of the diastereoisomers and/or of the optical isomers can be carried out according to methods known per se.

The present invention also encompasses all the possible tautomeric forms of the compounds, whether these tautomers occur in isolated form or in the form of mixtures.

According to the invention, lower alkyl or cycloalkyl is intended to mean a linear or branched alkyl group containing from 1 to 6 carbon atoms, or a saturated carbocycle containing 3 to 6 carbon atoms.

The position for substitution is preferably selected according the following order:

meta>para>ortho.

In this group, for nitrogen-containing ring bearing only one substituent, this latter is preferably in meta position with respect to the nitrogen-atom.

For nitrogen-containing ring bearing two substituents, meta-meta substitution is preferred, especially when these two substituents are in trans-relation.

According to the invention, piperidyl or pyrrolidinyl moiety substituted in meta or meta-meta position, especially with a methyl group, give particularly preferred compounds.

When  $\text{NR}^1\text{R}^2$  represents a N-substituted piperazino group, R may be a lower alkyl e.g. methyl.

Typical examples of group R being an aryl or arylalkyl moiety are phenyl and benzyl.

R may be also an alkanoyl or aroyl group e.g. acetyl or benzoyl.

In all the possible groups for R, the alkyl moiety refers to a linear or branched chain containing from 1 to 6 carbon atoms.

The cycloalkyl group refers to a saturated carbocycle containing 3 to 7 carbon atoms.

When R represents an aryl or arylalkyl group, the aryl moiety is especially a phenyl group optionally substituted with one or more substituents selected from halogen atoms, advantageously selected from fluorine, chlorine and bromine, or a lower alkyl or cycloalkyl, a trifluoromethyl, aryl, alkoxy, aryloxy, nitro, formyl, alkanoyl, aroyl, arylalkanoyl, amino, carboxamido, cyano, alkyloximino, aryloximino,  $\alpha$ -hydroxyalkyl, alkenyl, alkynyl, sulphamido, sulfamoyl, carboxamide, carboalkoxy, arylalkyl or oxime group.

R may be also an optionally substituted benzoyl, the substituent being as defined above with reference to the phenyl group.

Typical example of  $-\text{NR}^1\text{R}^2$  representing a N-substituted piperazino group is N-acetylpiperazino.

According to one aspect, the compounds of the invention have the following general formula (I):

in which:

- $C_nH_{2n}$  is a linear or branched hydrocarbon chain with  $n$  ranging from 2 to 8;
- $X$  is an oxygen or sulfur atom;
- 10 -  $n_3$  is an integer from 0 to 5;
- $R^3$  represents each independently
  - a halogen atom,
  - a lower alkyl or cycloalkyl, a trifluoromethyl, aryl, alkoxy,  $\alpha$ -alkyloxyalkyl, aryloxy, nitro, formyl, alkanoyl, aroyl,
  - 15 arylalkanoyl, amino, carboxamido, cyano, alkyloximino, alkylalkoximino, aryloximino,  $\alpha$ -hydroxyalkyl, alkenyl, alkynyl, sulphamido, sulfamoyl, sulphonamido, carboxamide, carbonylcycloalkyl, alkylcarbonylalkyl, carboalkoxy, arylalkyl or oxime group,
  - 20 • or taken together with the carbon atoms of the phenyl ring to which it is fused, a 5- or 6-membered saturated or unsaturated ring or a benzene ring.
- $R^1$  and  $R^2$  are as above-defined in formula (A).

25 A preferred group of compounds according to the invention is the group composed of compounds of formula (I) in which  $X$  is an oxygen atom.

Another preferred group of compounds comprises compounds (I) in which  $-C_nH_{2n}-$  is a linear chain  $-(CH_2)_n-$  with  $n$  being as previously defined.

Preferred compounds are also those with  $n$  varying from 3 to 5, and with  $n$  being more preferably 3.

30 A sub-class of compounds according to the invention comprises the compounds of formula (I) with  $n_3$  being zero that is those having an unsubstituted phenyl moiety.

Another group of compounds according to the invention is composed of compounds containing one or more substituents  $R^3$  which may be identical or different. In this group, the compounds having a mono- or di-substituted ( $n_3 = 1$  or 2) phenyl moiety are preferred and those mono-substituted with one group  $R^3$  as defined above in para-position are particularly preferred.

Among these compounds, ( $n_3$  being 1)  $R^3$  is preferably a halogen atom or a cyano, nitro, alkanoyl, alkyloximino or  $\alpha$ -hydroxyalkyl group.

Still more preferred compounds are those with  $R^3$  being CN,  $NO_2$ ,  $COCH_3$ ,  $COC_2H_5$ ,  $H_3C-C=N-OH$ ,  $H_3C-CH-OH$  and cycloalkyl-CO like cyclopropyl-CO.

$R^3$  being a halogen atom may be advantageously selected from fluorine, chlorine and bromine.

$R^3$  being an aryl group, may be especially a phenyl group.

In the other substituents  $R^3$ , the aryl moiety is advantageously a phenyl moiety.

$R^3$  being an aryloxy group may be especially a phenoxy group.

According to the invention, alkanoyl is intended to mean a group containing an alkyl moiety as defined above.

Typical examples of  $R^3$  being an alkanoyl, aroyl or arylalkanoyl group are acetyl, butyryl and propionyl groups, benzoyl group or phenylacetyl group.

Typical examples of  $R^3$  forming together with the carbon atoms of the phenyl ring to which it is fused, a saturated ring leads to 5,6,7,8-tetrahydronaphthyl or forming a benzene ring leads to a naphthyl moiety.

According to the invention, alkenyl or alkynyl group may contain advantageously from 1 to 8 carbon atoms, in particular from 1 to 6 carbon atoms and preferably 1 to 4 carbon atoms.

In carboalkoxy, carboxyamido, carbonylcycloalkyl, alkylcarbonylalkyl, or carboxamide groups, the hydrocarbon chain is saturated, linear or branched and contains an alkyl moiety as defined above.

In alkoxy, alkylalkoximino, alkyloximino,  $\alpha$ -alkyloxyalkyl, arylalkyl or  $\alpha$ -hydroxyalkyl group, the alkyl moiety is as previously defined also.

According to a thirteenth aspect, the invention is directed to non-imidazole compounds analogous to those disclosed in WO 95/11894.

Thus, the present invention is relative to a sub-class of compounds (A) comprising compounds having the following formula (XIII):

wherein  $R^1$  and  $R^2$  are as defined with reference to formula (A)  
wherein  $D^{XIII}$  is  $CH_2$  or  $CH_2-CH_2$ ,  $Z^{XIII}$  represents sulfur (S) or oxygen (O),

10 halogen atom, a lower alkyl or cycloalkyl, a trifluoromethyl, aryl, alkoxy,  $\alpha$ -  
alkyloxyalkyl, aryloxy, nitro, formyl, alkanoyl, aroyl, arylalkanoyl, amino,  
carboxamido, cyano, alkyloximino, alkylalkoximino, aryloximino,  $\alpha$ -hydroxyalkyl,

Their therapeutical applications are those known for H<sub>3</sub>-antagonist and/or agonist compounds and especially relate to the central nervous system disorders.

Regarding antagonistic activity, the compounds according to the invention can be used in the treatment of Alzheimer disease, mood and attention alterations, cognitive deficits in psychiatric pathologies, obesity, vertigo and motion sickness.

Regarding agonistic activity, the compounds according to the invention can be used in the treatment of various allergic and inflammatory diseases and as a sedative agent.

Therefore, the compounds of formula (A) according to the invention are advantageously used as active ingredient of medicaments which act as ligand for H<sub>3</sub>-receptors of histamine and in particular as an antagonist and/or agonist of H<sub>3</sub>-receptors of histamine.

for the preparation of a medicament acting as a ligand for the histamine H<sub>3</sub>-receptor  
and in particular as an antagonist and/or agonist of the histamine H<sub>3</sub>-receptors.

The antagonists are advantageously used as active ingredient in particular, of medicaments having psychotropic effects, promoting wakefulness, attention, memory and improving mood, in treatment of pathologies such as Alzheimer disease and other cognitive disorders in aged persons, depressive or simply asthenic states.

Their nootropic effects can be useful to stimulate attention and memorization capacity in healthy humans.

In addition, these agents can be useful in treatment of obesity, vertigo and motion sickness.

It can also be useful to associate the compounds of the invention with other psychiatric agents such as neuroleptics to increase their efficiency and reduce their side effects.

Application in certain form of epilepsy is also foreseen.

Their therapeutic applications involve also peripheral organs mainly a stimulant of secretions or gastro-intestinal motricity.

The compounds of the invention are particularly useful for the treatment of CNS disorders of aged persons.

The said compounds may also be used as an agonist or partial agonist action on the said histamine receptors.

H<sub>3</sub> receptor agonists and partial agonists, through their cerebral effects, mainly exert sedative, tranquillizing, antistress and analgesic activity, indicating their use as mild sedative psychotropics, in particular in various psychosomatic disorders.

H<sub>3</sub> agonists and partial agonists are also indicated in the treatment of migraine states and other headaches.

Through their peripheral effects, H<sub>3</sub> receptor agonists and partial agonists will be mainly indicated in the treatment of respiratory, allergic or inflammatory conditions (asthma, bronchitis, rhinitis, tracheitis, and the like), cardiac conditions (myocardial dysfunction and infarction), gastrointestinal conditions as a result of their antisecretory and anti-inflammatory actions (gastric and duodenal ulcers, ulcerative colitis, Crohn's disease, irritable bowel, faecal incontinence, and the like), conditions of the urogenital system (cystitis, metritis, premenstrual syndrome, prostatic inflammations, urinary incontinence, genital disorders) and conditions of the cutaneous system (urticaria, itching). The anti-inflammatory and analgesic effect may usefully be turned to good account in the treatment of arthritis and other rheumatic conditions, conjunctivitis and other ocular inflammations, and sialorrhoea.

Compounds which are histamine H<sub>3</sub> receptor agonists or partial agonists are advantageously used as active principle of medicinal products, in particular having mild sedative, antisecretory, anti-inflammatory, sleep-regulating and anticonvulsant effects, regulatory effects on hypothalamohypophyseal secretion, antidepressant effects, modulatory effects on cerebral circulation, modulatory effects on the immune system, and anti-allergic and antimigraine effects.

Hence the present invention also relates to pharmaceutical compositions which contain as active principle a therapeutically effective amount of one of the agonist or partial agonist compounds of formule (A).

The present invention also relates to medicaments having the above-mentioned effects comprising as active ingredient, a therapeutically effective amount of a compound of formula (A).

The present invention relates more particularly to such medicaments containing a compound of formula (I) to (XVIII).

The present invention also relates to pharmaceutical compositions containing as active ingredient, a therapeutically effective amount of a compound (A) together with a pharmaceutically acceptable vehicle or excipient.

The invention is directed to such pharmaceutical compositions containing as active-ingredient, a compound of formula (I) to (XVIII).

The medicaments or pharmaceutical compositions according to the invention can be administered via oral, parenteral or topical routes, the active ingredient being combined with a therapeutically suitable excipient or vehicle.

According to the invention, oral administration is advantageously used.

Another subject of the present invention is the use of the compounds of formula (A) for the preparation of H<sub>3</sub>-antagonist and/or agonist medicaments according to the above-mentioned forms.

The invention further relates to the use of the compounds of formula (A) for preparing medicaments having the pre-cited effects.

The invention also concerns the use of a compound of formula (I) to (XVIII).

Still another subject of the invention is a method for the treatment of precited ailments comprising administering a therapeutically effective dose of a compound (I), optionally in combination with a therapeutically acceptable vehicle or excipient.

The invention is also directed to such a method comprising administering a therapeutically effective dose of a compound of formula (I) to (XVIII).

For each of the above-indications, the amount of the active ingredient will depend upon the condition of the patient.

However, a suitable effective dose will be in general in the range of from 10 to 500 mg per day and of from 1 to 10 mg/day for particularly active compounds.

These doses are given on the basis of the compound and should be adapted for the salts, hydrates or hydrated salts thereof.

The invention is now illustrated by the following examples.

Compounds 1 to 114 are prepared according to the following procedures:

METHOD A:

A solution of 1-bromo-5-phenoxyptane (1.4 to 3.5 mmol) in ten equivalents of the suitable secondary amine was heated to reflux temperature with stirring for 48 hours (compds. 1, 3 and 4), 24 hours (compd. 2) or 4 hours (compd. 5). After cooling, the excess base was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with diethyl ether, the organic extracts washed with water, dried over magnesium sulphate, filtered and concentrated under reduced pressure. The remaining oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. The precipitate formed was washed with diethyl ether and recrystallised from absolute ethanol.

METHOD B:

A solution of 1-bromo-5-phenoxyptane (0.9 to 1.7 mmol) and an excess of the suitable secondary amine (2.3 to 10 equivalents) in 10 ml absolute ethanol was heated to reflux temperature with stirring for 48 hours (compd. 6) or 24 hours (compds. 7, 8, 9, 10, 11, 12&13, 14, 15, 16, 17 and 29). After cooling, the solvent was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with diethyl ether, the organic extracts washed with water, dried over magnesium sulphate, filtered and concentrated under reduced pressure. The cis and trans isomers 12 and 13 were separated by column chromatography on silica gel eluting with a solvent mixture of petroleum spirit (bp 60-80°C), diethyl ether and triethylamine in the ratio 66:33:1, and the eluent was removed under reduced pressure to leave an oil. Compounds 14 and 16 were purified by column chromatography on silica gel eluting with diethyl ether and triethylamine in the ratio 99:1, and the eluent was removed under reduced pressure to leave an oil. The oil was converted to oxalate salt (compds. 6, 7, 8, 9, 11, 12, 13, 15, 16, 17 and 29) by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents of oxalic acid in absolute ethanol. If no precipitate appeared, diethyl ether was

added to form a precipitate. The solid was washed with diethyl ether and recrystallised from isopropyl alcohol (comps. 6, 7, 10, 13 and 16), absolute ethanol (comps. 8, 9, 11, 12, 15 and 29) or methanol (compd. 17). The oil was converted to hydrochloride salt (compd. 14) by adding 2N HCl. The precipitate was formed in a mixture of chloroform and diethyl ether (1:1) and recrystallised from acetone.

#### METHOD C:

A solution of the suitable  $\alpha$ -bromo- $\omega$ -aryloxy alkane (0.4 to 1.4 mmol) or  $\omega$ -bromoalkyl phenyl sulphide (1 mmol, comps. 33 and 34) and an excess of pyrrolidine (10 to 15 equivalents) or 3-methylpiperidine (10 equivalents, compd. 38) in 10 ml absolute ethanol was heated to reflux temperature with stirring for 24 hours or 16 hours (compd. 47). After cooling, the solvent was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with diethyl ether, the organic extracts washed with water, dried over magnesium sulphate, filtered and concentrated under reduced pressure. The remaining oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. If no precipitate appeared, diethyl ether was added to form a precipitate. The solid was washed with diethyl ether and recrystallised from absolute ethanol.

#### METHOD D:

A solution of the suitable 4'-(5-bromopentoxy)phenyl ketone (0.7 to 1 mmol, comps. 39, 44 and 45) or 1-bromo, 5-(4-phenoxyphenoxy)pentane (0.6 mmol, compd. 48) and an excess of pyrrolidine (10 to 15 equivalents) in 10 ml absolute ethanol was heated to reflux temperature with stirring for 16 hours (comps. 39, 44 and 48) or 24 hours (compd. 45). After cooling, the solvent was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with chloroform (comps. 39, 45 and 48) or dichloromethane (compd. 44), the organic extracts dried over magnesium sulphate, filtered and concentrated under reduced pressure. The remaining oil was converted to oxalate salt by dissolving in a small amount of absolute

ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. The precipitate was washed with diethyl ether and recrystallised from absolute ethanol (recrystallised twice from absolute ethanol in the case of compd. 39).

5    METHOD E:

1. The oxalate 18 was prepared according to method C. A solution of compound 18 (0.57 mmol) in 10 ml methanol and 10 ml absolute ethanol was placed with 100 mg of palladium (5%) on carbon catalyst in a two-neck round-bottom flask fitted with a balloon filled with hydrogen. The mixture was stirred vigorously at room temperature and the flask was purged of air and filled with hydrogen. After 3 hours, the catalyst was filtered off on celite and the solvent removed under reduced pressure. The residual solid was converted to oxalate salt by dissolving in methanol and adding a solution of oxalic acid (2 equivalents) in absolute ethanol. Diethyl ether was added to form a precipitate.
- 15    The product was recrystallised from absolute ethanol.

2. To a solution of compound 40 (0.35 mmol) in pyridine vigorously stirred at 0°C was added dropwise a slight excess of benzoyl chloride (0.4 mmol). The stirring was allowed to continue 20 minutes after the end of the addition after which the mixture was placed in the refrigerator overnight (16 hours). The solvent was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with chloroform, the organic extracts dried over magnesium sulphate, filtered and concentrated under reduced pressure. The remaining oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. The precipitate was dissolved in methanol, filtered, and concentrated under reduced pressure. The solid was recrystallised from absolute ethanol.
- 25

METHOD F:

- 30    In a three-neck flask kept under nitrogen was placed a solution of the suitable phenol (1.6 mmol), 3-(diethylamino)propanol (1.5 mmol), and triphenyl phosphine (1.9 mmol) in 10 ml freshly distilled tetrahydrofuran. The mixture was stirred and cooled to 0°C with an ice and salt bath. A solution of diisopropyl

azodicarboxylate (2 mmol) in 10 ml tetrahydrofuran was added very slowly (typically over 40 minutes) and the mixture was allowed to warm to room temperature after which it was stirred overnight at room temperature (16 hours). The solvent was then removed under reduced pressure, the residue dissolved in ethyl acetate (20 ml) and the product extracted with 2N HCl (2x10 ml). The aqueous solution was neutralised with sodium hydroxide and the product extracted with dichloromethane. After drying over magnesium sulphate and filtration, the solvent was removed under reduced pressure. The residue was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. If no precipitate appeared, diethyl ether was added to form a precipitate. The solid was washed with diethyl ether and recrystallised from absolute ethanol (compds. 43 and 46) or from a 1:1 mixture of methanol and absolute ethanol (compd. 42).

#### METHOD G:

A solution of the free base of compound 39 (0.6 mmol) or compound 46 (0.8 mmol) in 20 ml dry diethyl ether was added dropwise to a stirred suspension of lithium aluminium hydride (0.6 or 0.8 mmol) in 20 ml dry diethyl ether kept under nitrogen. The mixture was stirred at room temperature under nitrogen for two hours. Ice-cold water was carefully added and the organic layer decanted. The aqueous phase was extracted with diethyl ether. The combined organic solutions were dried over magnesium sulphate, filtered and concentrated under reduced pressure to leave a yellow oil. The oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. The precipitate was washed with diethyl ether and recrystallised from absolute ethanol (compd 50) or from isopropyl alcohol, giving a very hygroscopic solid (compd. 63).

#### METHOD H:

A solution of the suitable  $\alpha$ -bromo- $\omega$ -(4-cyanophenoxy) alkane (0.5 to 0.7 mmol) and an excess of the suitable secondary amine (8 to 12 equivalents) in 10 ml absolute ethanol was heated to reflux temperature with stirring for 24 hours

(compds. 54, 55, 57 and 60), 20 hours (compd. 52), 16 hours (compds. 56, 58, 59 and 61) or 8 hours (compd. 51) or was stirred at room temperature for 48 hours (compd. 53) or 24 hours (compd. 60). After cooling, the solvent was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with diethyl ether, the organic extracts washed with water, dried over magnesium sulphate, filtered and concentrated under reduced pressure. Compound 62 was purified by column chromatography on silica gel eluting with ethyl acetate, and concentrated under reduced pressure. For all the compounds of method H, the remaining oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. If no precipitate appeared, diethyl ether was added to form a precipitate. The solid was washed with diethyl ether and recrystallised from absolute ethanol (two recrystallisations were required for compds. 58 and 59) or from a 1:1 mixture of methanol and absolute ethanol (compd. 55).

#### METHOD J:

A solution of compound 46 (1 mmol) in 10 ml methanol was stirred at room temperature and a solution of hydroxylamine hydrochloride (2 equivalents) in 2 ml water was added. The mixture was stirred at 50-70°C in a water bath for 20 minutes. Methanol was removed under reduced pressure. The residue diluted with aqueous sodium hydroxide. The product was extracted with diethyl ether, the organic extracts washed with water, dried over magnesium sulphate, filtered and concentrated under reduced pressure. Compound 64 was purified by column chromatography on silica gel eluting with ethyl acetate, and concentrated under reduced pressure. The remaining oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. Diethyl ether was added to form a precipitate. The solid was washed with diethyl ether and recrystallised from absolute ethanol.

For example 98, the product was converted to the hydrochloride salt by addition of 2N HCl. The salt was recrystallised from absolute ethanol/diethyl ether (1:1).

METHOD K:

- A solution of 4'-(3-bromopropoxy)acetophenone (0.8 to 1.9 mmol) and an excess of the suitable piperidine (3 to 10 equivalents) in 10 ml absolute ethanol was heated to reflux temperature with stirring for 16 hours. After cooling, the solvent was removed under reduced pressure and the residue diluted with aqueous sodium hydroxide. The product was extracted with diethyl ether, the organic extracts washed with water, dried over magnesium sulphate, filtered and concentrated under reduced pressure. The cis and trans isomers 67 and 70 were separated by column chromatography on silica gel eluting with a solvent mixture of diethyl ether, petroleum spirits (bp 60-80°C) and triethylamine in the ratio 66:33:1, and the eluent was removed under reduced pressure to leave an oil. Compound 75 was purified by column chromatography on silica gel eluting with chloroform and methanol (1:1), and concentrated under reduced pressure. The remaining oil was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents of oxalic acid in absolute ethanol. If no precipitate appeared, diethyl ether was added to form a precipitate. The solid was washed with diethyl ether and recrystallised from absolute ethanol.

METHOD L:

- In a three-neck flask kept under nitrogen was placed a solution of the suitable 4'-hydroxyphenyl ketone (0.9 to 3 mmol), 3-(1-piperidinyl)propanol (0.9 to 3 mmol), and triphenyl phosphine (1 to 3.5 mmol) in 10 ml freshly distilled tetrahydrofuran. The mixture was stirred and cooled to 0°C with an ice and salt bath. A solution of diethyl azodicarboxylate (1 to 3.6 mmol) in 10 ml tetrahydrofuran was added very slowly (typically over 40 minutes) and the mixture was allowed to warm to room temperature after which it was stirred overnight at room temperature (16 hours). The solvent was then removed under reduced pressure, the residue dissolved in ethyl acetate (20 ml) and the product extracted with 2N HCl (2x10 ml). The aqueous solution was neutralised with sodium hydroxide and the product extracted with dichloromethane. After drying over magnesium sulphate and filtration, the solvent was removed under reduced pressure. The crude product was purified by column chromatography

on silica gel eluting with diethyl ether containing 1% triethylamine, and concentrated under reduced pressure. The residue was converted to oxalate salt by dissolving in a small amount of absolute ethanol and adding a solution of two equivalents oxalic acid in absolute ethanol. If no precipitate appeared, diethyl ether was added to form a precipitate. The solid was washed with diethyl ether and recrystallised from absolute ethanol.

For example 82, the amine was converted to the hydrochloride salt by addition of 2N HCl. The salt was recrystallised from absolute ethanol/diethyl ether (1:14).

#### Method M:

A solution of 3-(4-acetylphenoxy)-2-(R or S)-methylpropyl *para*-toluene sulfonate (0.55 to 0.66 mmol) and piperidine (5 to 6 mmol) in 10 ml absolute ethanol was stirred and heated under reflux for 2 hours. After cooling, the solvent was removed under reduced pressure, the residue diluted with aqueous NaOH (10 ml) and the oil was extracted with diethyl ether (3 x 10 ml). The combined extracts were dried over magnesium sulfate, and the solvent removed under reduced pressure. The yellow oil was purified by column chromatography on silica gel eluting with a 1:1 mixture of chloroform and absolute ethanol (example 80). After concentration, the oil was dissolved in about 2 ml absolute ethanol and a solution of oxalic acid (1 to 1.1 mmol) in 2 ml absolute ethanol was added. The precipitate was recrystallised from absolute ethanol.

#### Method N:

A solution of 1-bromo-3-(4-substitutedphenoxy)propane (0.4 to 2 mmol) and the suitably substituted piperidine (2.5 to 8 mmol) in 10 ml absolute ethanol was stirred and heated under reflux for 6 to 24 hours. After cooling, the solvent was removed under reduced pressure, the residue diluted with aqueous NaOH (10 ml) and the oil was extracted with diethyl ether (3 x 10 ml). The combined extracts were dried over magnesium sulfate, and the solvent removed under

reduced pressure. The residual oil was dissolved in about 5 ml diethyl ether and a solution of HCl in 10 ml diethyl ether was added. The precipitate was recrystallised from a 1:1 or 1:5 mixture of absolute ethanol and diethyl ether (examples 78, 79, 84, 87). The oil was purified by column chromatography on silica gel eluting with a mixture of 33% petroleum ether (60-80°C), 66% diethyl ether and 1% triethylamine (examples 101 and 102) or with 99% diethyl ether and 1% triethylamine (examples 88, 94 and 95) and concentrated. The residual oil was dissolved in about 5 ml absolute ethanol and a solution of oxalic acid (1 to 1.6 mmol) in 5 ml absolute ethanol was added. The precipitate was recrystallised from absolute ethanol or from a 1:1 mixture of methanol and absolute ethanol (examples 83, 85, 86, 91, 93, 100, 101 and 102). The product was obtained as a sticky oil after removal of absolute ethanol (example 92).

#### Method O:

A mixture of 4-(4-hydroxyphenyl)-2-butanone (200 mg, 1.2 mmol), 3-chloropropyl piperidine hydrochloride (200 mg, 1 mmol) and potassium carbonate (830 mg, 6 mmol) in 10 ml absolute ethanol was stirred and heated under reflux for 8 hours. After cooling, the reaction mixture was filtered and concentrated under reduced pressure. The residue was diluted with aqueous sodium hydroxide and extracted with diethyl ether (3 x 10 ml). The combined extracts were dried over magnesium sulfate, and the solvent removed under reduced pressure. The free base was dissolved in diethyl ether and a solution of HCl in diethyl ether was added. The precipitate was recrystallised from acetone.

#### Method P:

A solution of the ketone (0.4 mmol) in 10 ml methanol was stirred at 0°C in an ice-bath. To this solution was added portionwise NaBH<sub>4</sub> (1 mmol). The mixture was left to stir at room temperature for 16 hours. The solvent was removed, water (10 ml) was added to the residue and the product was extracted with chloroform (4 x 10 ml). The combined extracts were dried over magnesium sulfate, and the solvent removed under reduced pressure. The free base was

dissolved in absolute ethanol (5 ml) and a solution of oxalic acid (1 mmol) in 5 ml absolute ethanol was added. The precipitate was recrystallised from absolute ethanol.

5    Method Q:

Similar to method J using methoxylamine in place of hydroxylamine. For example 105, the product was converted to the hydrochloride salt by addition of 2N HCl. The salt was recrystallised from absolute ethanol/diethyl ether (1:3).

10

Method R:

15

Similar to method P. The reduced product was converted to the hydrochloride salt by addition of 2N HCl. Then, the product was converted to the free base by addition of 10% aqueous NaOH. Then, the product was converted to the para-toluene sulfonate by addition of a solution of para-toluene sulfonic acid (1 mmol) in 5 ml absolute ethanol. The precipitate was recrystallised from absolute ethanol/diethyl ether (1:3).

20

Method S:

25

Similar to method P. The reduced product was converted to the para-toluene sulfonate by addition of a solution of para-toluene sulfonic acid (1 mmol) in 5 ml absolute ethanol. The precipitate was recrystallised from absolute ethanol/diethyl ether (1:3).

20 Pharmacological study

Interaction of compounds with the H<sub>3</sub> receptor are evidenced *in vitro* by the measurement of the release of neosynthesized tritiated histamine from rat cerebral cortex synaptosomes preincubated with tritiated histidine (Garbarg et al., J. Pharmacol. Exp. Ther., 1992, 263 : 304-310). The H<sub>3</sub> potency  
25 of agonists is measured by the inhibition of tritiated histamine release and that of antagonists by the progressive reversal of release inhibition by the selective H<sub>3</sub> agonist (R) $\alpha$ -methylhistamine (Arrang et al., Nature, 1987, 327: 117-123).

Interaction of compounds with the H<sub>3</sub> receptor are evidenced *in vitro* on guinea-pig ileum by the procedure described by Ligneau et al., J. Pharmacol. Exp. Ther. 271, 452-459 (1994).  
30

Briefly, longitudinal muscle strips from guinea-pig small intestine were dissected out and incubated in a gassed O<sub>2</sub>/CO<sub>2</sub> (95 %/5 %) modified Krebs-Ringer's bicarbonate medium at +37°C in presence of 1  $\mu$ M mepyramine

to block the H<sub>1</sub> receptor. After equilibration, contractile activity under stimulation (rectangular pulses of 15 V, 0,5 msec, 0,1 Hz) was recorded.

Concentration-response curves of the effect of (R) $\alpha$ -Methylhistamine alone or together with the antagonist were established.

- 5           The effects of agonists and antagonists were estimated *in vivo* by the measurement of the tele-methylhistamine level variations in the brain of mice (Garbarg et al., J. Neurochem., 1989, 53: 1724-1730). At various time after p.o. administration of the compounds, the effect of agonists and antagonists are evidenced by the decrease and increase respectively in  
10 telemethylhistamine level induced.

The changes are compared to those induced by reference compounds given in high dosage and this allows the calculation of the ED<sub>50</sub> value for each compound which correspond to the dose responsible for an half maximal effect.

- 15           The results are listed here-below or reported in the following tables II and III:
